

Hostile MRB - Mode 3 thin moot CLI (2026-09-19)

Hostile MRB - Mode 3 thin moot CLI (2026-09-19)

****Repo:**** SimonBarnett/agentica_irc
****Commit:**** `bd789b8` feat: Mode 3 thin moot CLI P0-P3 (Win32 ANSI, not Win95 TLS)
****Job:**** jonos `9f96bc0e-7517-4f01-98fc-ba792a1b28b1`
****Spec:**** docs/feature-request-mode3-win95-thin-moot-cli-2026-09-19.md + docs/build-and-test-plan-mode3.md

Verdict

****PASS-with-nits**** for the ****first ticket**** (P0-P3).
****Not ready for human UAT.**** A5 live IONOS moot+exec smoke is still open.

Honest about Win95: U1 closed as unclaimed; live Libera floor documented as Win8 / Server 2012+. That matches the plan defaults. It does ****not**** satisfy a literal "runs on Windows 95" reading of the original ask - and the docs correctly refuse to fake that.

Evidence

Gate	Result
A1 Release binary	****Pass.**** Releases `mode3-thin` and `airc-moot-thin-v0.1.0` published by Actions.
A2 Rebuild updates release	****Pass.**** Workflow `mode3-thin-release` run 1 conclusion ****success**** on `bd789b8`.
A3 Offline tests	****Pass.**** `pytest -q` -> ****103 passed, 2 skipped****. Local `airc-moot-thin.exe --selftest` ok (jail, operators, AES-GCM vector, exec, truncation, moot JOIN). Offline `--job-in` ping -> `ok:true`.
A4 OS matrix	****Pass.**** docs/mode3-os-matrix.md + mode3-tls-spike.md; Win95/98/NT4/XP live rows blocked.
A5 IONOS live smoke	****Fail / not run.**** Matrix and build agent both say Phase 4 not done. No hostname-to-cm-bob evidence.
A6 Bob UAT phrase	****Correctly withheld.****
PE shape	i386 (`0x14c`), PE32, subsystem CONSOLE (3). Exe ****not**** tracked in git (gitignore).
CI test workflow	****success**** on same SHA.

Release URLs:

- https://github.com/SimonBarnett/agentica_irc/releases/tag/mode3-thin
- https://github.com/SimonBarnett/agentica_irc/releases/tag/airc-moot-thin-v0.1.0

Actions:

- https://github.com/SimonBarnett/agentica_irc/actions/runs/35461747146 (release)
- https://github.com/SimonBarnett/agentica_irc/actions/runs/35461747150 (test)

What landed (credit only where evidenced)

- P0 docs: TLS spike, release policy, OS matrix.
- P1 fixtures + `tests/test\_moot\_thin\_proto.py`.
- P2 Win32 ANSI sources under `src/moot\_thin/` (Schannel, DUMB v1 jobs, jail, `--operators`, `--selftest` / `--offline`).
- P3 `.github/workflows/mode3-thin-release.yml` rolling + immutable tags.
- Defaults held: Win32 ANSI (not 16-bit DOS), DUMB jobs + moot JOIN, operators required, no Win95 TLS claim, Mode 1/2 Python left alone, .NET Phase 5 untouched.

Non-conformances / required follow-ups

NC-01 (blocker for human UAT) - A5 live smoke missing

Run on IONOS: chair `cm-bob` OPEN moot; start release `airc-moot-thin.exe` with real key + operators; sealed `exec hostname` (or equivalent); stdout visible to chair. Paste log excerpt into `docs`. Until then ****do not**** say ready for human UAT.

NC-02 (nit) - Original "Win95" ask remains unsatisfied

Product is XP-era compile macros + Win8+ live TLS. Acceptable for P0 plan defaults; if Simon still wants a true 9x PE, that is a ****new**** spike (OpenWatcom + static TLS or relay), not a silent claim on this artefact.

NC-03 (nit) - `moot.c` is minimal

JOIN-focused stub is fine for thin client; confirm live smoke exercises roster visibility from Python chair. Expand only if smoke shows missing verbs.

NC-04 (nit) - Local untracked `tools/` on ionos clone

Working tree showed `?? tools/` after pull - confirm it is not a forgotten Mode-3 deliverable; do not commit junk.

Pass bar for next MRB (UAT-ready)

- NC-01 live smoke evidence in `/docs`
- No secret leaks in release assets (already clean)
- Selftest + pytest still green
- Bob may then say ****ready for human UAT**** of Mode 3 on Win8+ only

Hand-off

Optional build agent: Phase 4 A5 IONOS live smoke + doc only. Do not re-litigate P0-P3 unless smoke finds bugs.
